

1. Attached is an excel sheet with sample inventory data. Build an agent that answers questions about a provided excel dataset. The agent must be able to: write and execute code to query the data, look up definitions or context using a search tool, and summarise findings in plain English. The user should be able to interact with it via a simple chat interface.
2. Using your own documents as a knowledge base, build a document-aware support assistant that maintains context across a multi-turn conversation. The assistant should: remember what the user has already asked within the session, avoid repeating information it has already provided, gracefully handle topic switches, and cite the specific document section it is drawing from in each response. Demonstrate it across a conversation of at least 10 turns.
3. You are provided with a set of 10 mixed documents spanning identity proofs and insurance proposal forms. Build a pipeline that: (1) classifies each document by type, (2) extracts the specific fields listed below for each document type, and (3) flags any document or field it cannot extract with high confidence for human review. Pay particular attention to handwritten fields — these are the primary test of your pipeline's robustness.

Required extraction targets by document type:

Document Type	Fields to Extract
Aadhaar Card	Aadhaar Number, Full Name, Date of Birth, Address
PAN Card	PAN Number, Full Name, Father's Name, Date of Birth
Driving Licence	DL Number, Name, Date of Issue, Valid Till date
Passport	Passport Number, Date of Birth, Date of Expiry, MRZ Line 2
NACH / ECS Mandate <i>(handwritten)</i>	Bank Account Number, IFSC Code, Bank Name, Amount (figures), Frequency
FATCA Annexure Form <i>(handwritten)</i>	Policy Number, TIN / PAN, Father's Name, Place of Birth, Nationality
Benefit Illustration Declaration <i>(handwritten)</i>	Application Number, Policyholder Name, Date, Place

Moral Hazard Questionnaire
(handwritten)

Application Number, Name of Life Assured,
Nominee Relationship, Date, Place

Multiple Policies Consent
Form *(handwritten)*

Proposer Name, Reason for Multiple Policies
(selected checkbox), Date, Place

Suitability Profiler
Declaration *(handwritten)*

Application Number, Name of Life Assured, Name
of Agent/SP, Date, Place

Deliverables:

- Extraction output as structured JSON for each document
- A confidence score per field (not just per document)
- A flagging report listing fields below your confidence threshold, with the threshold value you chose and your rationale for it
- A brief note on how you handled handwritten text differently from printed text, and any failure cases you observed

Evaluation criteria: Field-level accuracy will be assessed against a ground truth answer key. Particular weight will be given to correct extraction of handwritten fields — IFSC, TIN, bank account numbers, dates, and place names — as these are the highest-value and hardest targets in a real insurance onboarding pipeline.
